EXPERIMENT 4

DATA MODELLING AND FORM DESIGN

AIM

To design and implement an Insurance Claim Request Form in Zoho Creator using appropriate data fields, validations, and a report for managing insurance claim information.

THEORY

Data modelling and form design are essential components of low-code application development, enabling developers to structure business data and build intuitive user interfaces without extensive manual coding. In platforms such as Zoho Creator, data modelling involves designing forms that act as the primary interface for capturing, validating, and storing information within an underlying database structure.

Key concepts involved in data modelling and form design include:

- Field Types: Basic field types such as text, number, date, dropdown, radio button, and multi-select fields allow developers to capture structured data efficiently.
- Mandatory Fields: Marking essential fields as mandatory ensures that critical information is not left incomplete when a form is submitted.
- Validation Rules: Field-level validations, such as email format, phone number pattern, and numeric ranges, help maintain data accuracy and consistency.
- Form Sections: Grouping related fields, such as claimant details, policy details, contact details, and incident details, improves readability and user experience.
- Reports: Reports are auto-generated views that display submitted form data in tabular format, allowing users to view, filter, sort, and manage records easily.
- Workflow Integration: Forms can be linked with workflows to trigger notifications, approvals, or status updates automatically upon submission.

By combining structured data models with well-designed forms, low-code platforms like Zoho Creator allow organizations to rapidly build reliable data-capture applications, such as insurance claim management systems, thereby reducing development time and minimizing manual errors.

OBJECTIVE

To create a structured digital insurance claim request form that captures claimant, policy, contact, incident, claim amount, supporting document, callback, and declaration details.

PROCEDURE

1. Open the Insurance Claim application in Zoho Creator and open the Claim_Request_Form.

2. Design the form using the required basic field types and configure the necessary mandatory fields.

3. Configure the claimant, contact, policy, claim, incident, scheduling, and declaration fields.

4. Configure the Claim_Request_Report to display submitted claim information.

5. Add sample claim records and verify that the submitted information appears correctly in the report.

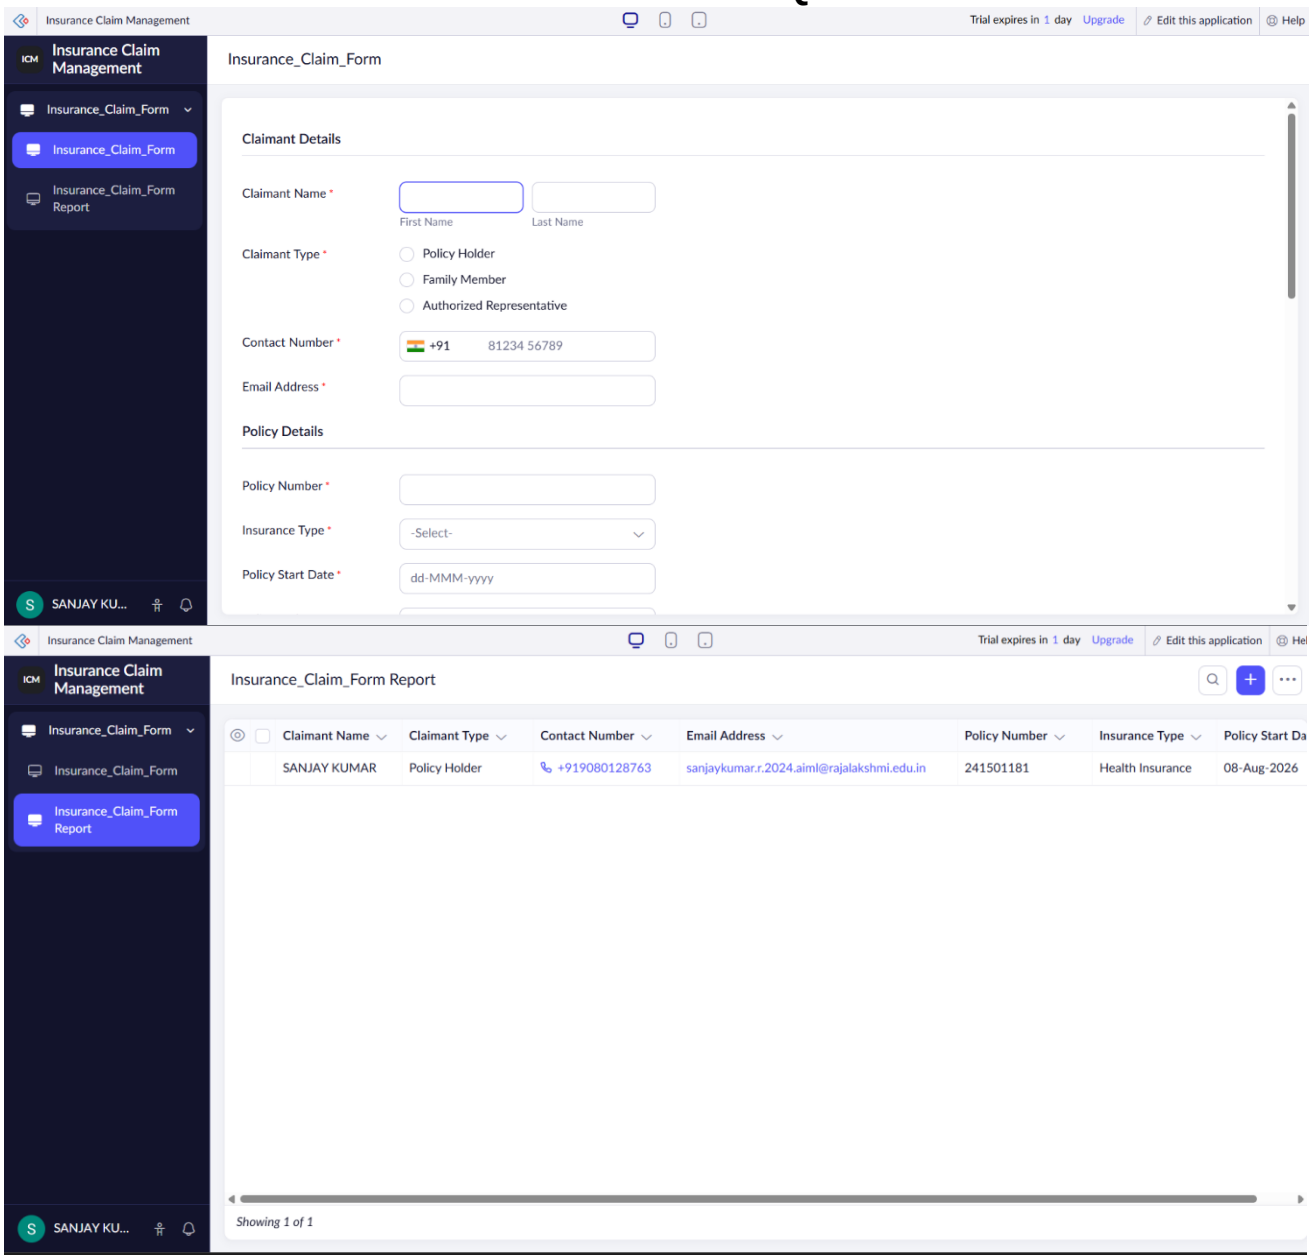

FIGURE 4.3 — CLAIM REQUEST REPORT WITH THREE SAMPLE RECORDS

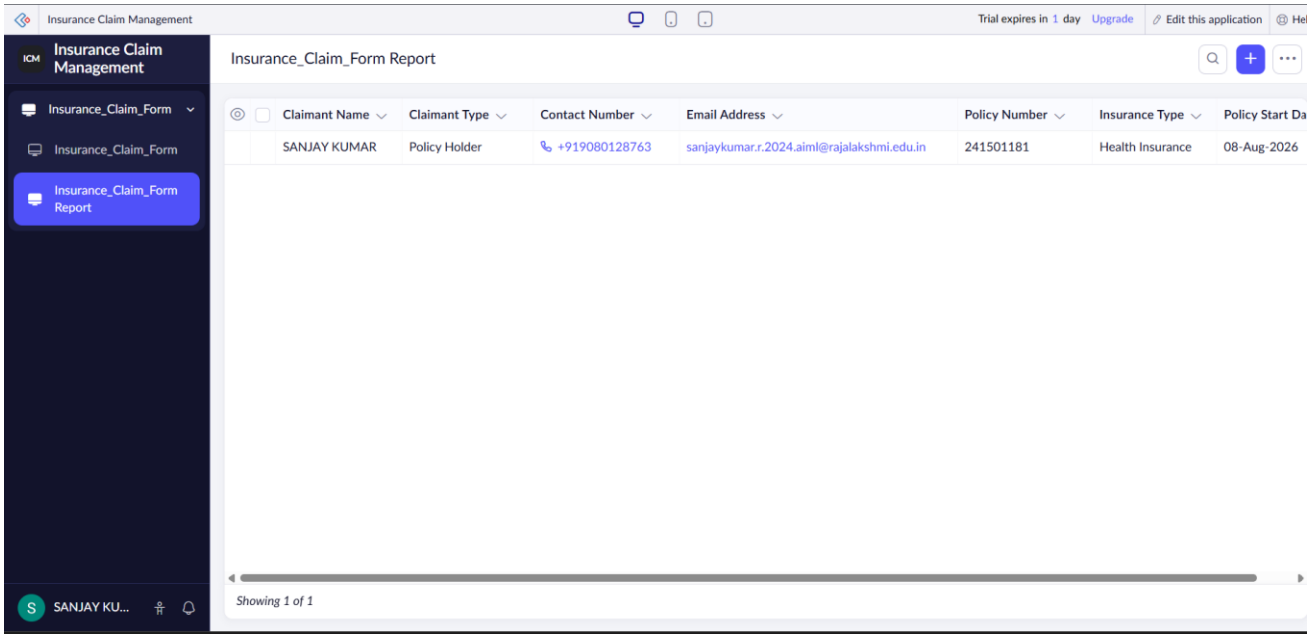

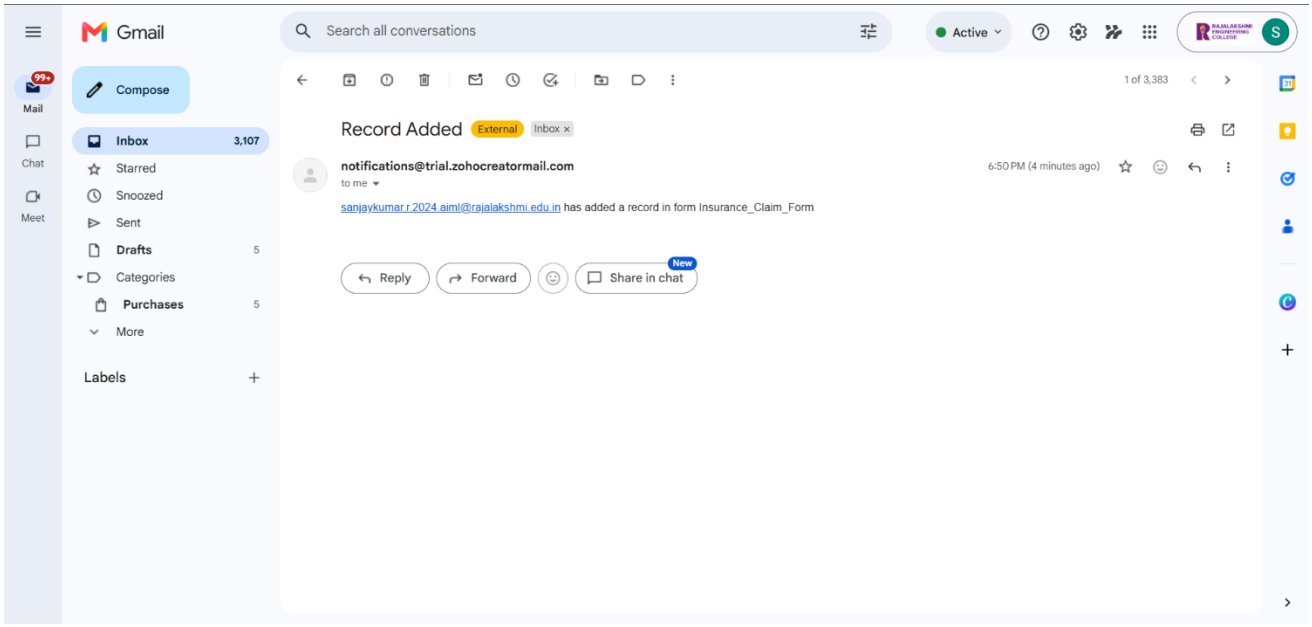

FIGURE 4.4 — INSURANCE CLAIM SUBMISSION CONFIRMATION EMAIL

RESULT

The Insurance Claim Request Form was successfully designed in Zoho Creator and the Claim_Request_Report was populated with three sample claim records. Upon submission, a confirmation email acknowledging successful receipt of the claim was generated automatically, verifying that the form, workflow, and report together provide a structured and reliable method for collecting, processing, and viewing insurance claim information.
